Overview

Specification

The 3M 6035 P3 Particulate Filters are replacement filters suitable for use with a wide range of 3M's reusable masks. The 6035 filters have a larger surface area than many standard filters and a lightweight, easy-fit design. They provide protection against solid and liquid particles, and are supplied in a wipe clean plastic case.

The 6035 particulate filters can be used with half or full face 3M reusable masks that have a bayonet-style connection. Their shape is designed to offer low breathing resistance while also giving a clear field of vision. The filters have a sprung mechanism, which allows the user to quickly perform a face seal check. They are encased for durability and to protect the filters when used in harsh environments or where rapid decontamination is needed.

P3 - protects against harmful or carcinogenic dusts, water and oil based mists or aerosols and biological agents of risk groups 2 and 3 in concentrations of up to 20 x WEL.

R - reusable. The filter can be used for longer than one shift and fulfils the 120 mg loading test with solids and liquid aerosols.
